

By April '21, it was clear that more people than usual were suffering from **blood clots and strokes**. Several European countries then suspended the use of the Astra-Zeneca vaccine.

Researchers in Denmark www.sharewellness.co.uk/a1 asked if the blood clots/strokes were, in part, due to vaccinators failing to avoid blood vessels.

Denmark was the only country to re-train **all** vaccinators to check the dose would not be delivered entirely into the bloodstream.

Dr John Campbell trained UK health-care workers in safe injection techniques for 35 years. On hearing of the Danish authority's decision to re-train staff, he immediately called on the NHS to do the same. Results from Denmark soon indicated the Danes had made the right decision. Dr Campbell then wrote to his MP and started to encourage his YouTube followers to **alert everyone to risks from poorly delivered vaccines**.

After 6 months of comparison of Danish adverse reactions with those in Norway (where vaccinators were not re-trained) a peer-reviewed article www.sharewellness.co.uk/a2 has been published.

Poor injection technique has been confirmed as the main cause of clots, strokes and myocarditis following vaccination.

Almost a year on from the Danes warning the world of a medical crisis, Germany has accepted all of their vaccinators need re-training. The UK/NHS still have not.

Please show this leaflet to your doctor and anyone else who can help make the necessary changes.
